TEAM ROYAL CODERS · IMPRENDITORE 5.0

KiranaFlow -> Small Business Brain

Apne purane project ko PS ke hisaab se badalne ka plan

1. Pehle ye samajh lo (sabse zaroori)

Rule (event document): "Pre-built projects, previously developed prototypes ... must not be submitted as work created during the event" aur "All core project work must be completed during the official hackathon duration". Disqualification list me bhi **pre-built project** likha hai.

KiranaFlow ki LICENSE me copyright: "Priyanshu Jaiswal, 2026" (MIT). Agar ye tumhari team ka hi project hai to bhi ye event se **pehle ka** hai. Agar kisi aur ka hai to MIT license code use karne deta hai, par use **apna event-kaam bata kar dikhana plagiarism** maana jayega.

Isliye main ye plan **transparent tareeke** se bana raha hu: KiranaFlow ko "existing base" maan kar disclose karo, aur **asli core (Brain engine) event me naya banao**. Origin chhupana ya poore project ko event me bana hua bolna mat. Wo pakda gaya to poori team disqualify ho sakti hai, aur wo is plan se bhi nahi bachta.

Ye 4 kaam aaj hi karo

- **E-Cell coordinators se poochho (registration desk par, abhi):** "Humara ek purana open-source (MIT) base hai. Uske upar hum event me naya analytics layer bana rahe hain. Kya base disclose karke ye allowed hai?" Jawab **likhit/WhatsApp par** le lo, aur screenshot rakho.
- **Naya GitHub repo** banao. Pehla commit: "Baseline: KiranaFlow (MIT, (c) Priyanshu Jaiswal, pre-existing)". Uske baad **saara event kaam alag commits me**. Isse diff me saaf dikhega kya naya hai.
- **LICENSE file ko jaisa hai waisa rakho** (MIT ki shart), aur README me credit likho (section 6).
- Agar coordinators **mana** karein to turant **Plan B** par jao: naya repo (pehle wala backend zip + mockups already ready). Plan B ka time kam hai, isliye jawab subah hi lo.

2. KiranaFlow me kya hai aur PS kya maangta hai

KiranaFlow ek **order-taking operator** hai: voice/text se order, bill, customer lookup, delivery message. PS ka core hai **sales + inventory + expenses analytics aur recommendations**. Order-taking PS me nahi poocha gaya, isliye wo hissa demo me dikhane se judges ko lagega ki project PS se alag hai.

PS ki demand	KiranaFlow me abhi	Gap
Sales analytics	Sales/profit today-week-month (dashboard)	Chhota gap: trend, per-SKU, weekday pattern
Inventory analytics	Stock, CP/SP/margin, low-stock	**Bada gap**: forecast, days-left, reorder qty, dead stock
Expenses	Nahi hai	**Poora naya**: model, API, UI, anomaly
Recommendations	Nahi hai (sirf low-stock/pulse)	**Poora naya**: ranked actions + ₹ impact
Simple UX for dukaandar	Desktop dashboard + sidebar	Mobile-first 5 screens (mockups ready)

3. File-by-file plan

Note: ye mapping file names, README aur line counts se hai. Har file ko khol kar ek baar verify karo, phir kaam shuru karo.

RAKHO (base ke roop me, disclosed)

File	Kaam	Is project me use
backend/app/main.py, config.py, database/__init__.py	FastAPI app, env config, DB session	Jaise hai, naye routers jodo
backend/app/models/__init__.py	Product (CP/SP/stock), orders etc.	**Expense** model add karo; sales ke liye order items use
backend/app/database/seed.py	Demo data	60-din sales + expenses + dead-stock/margin-leak stories add karo
backend/app/services/ai_provider.py	Gemini + mock fallback	Ask Brain me explanation ke liye reuse
backend/app/services/language_rules.py	Hinglish parsing	Quick entry ("2 atta becha") ke liye reuse
backend/app/api/dashboard.py	P&L, inventory stats	Overview endpoint ka base; engine ke numbers se merge
frontend: App.tsx, Topbar, Sidebar, index.css, api.ts, types	Shell, routing, API client	Navigation 5 screens par badlo
frontend/pages/Inventory.tsx, Dashboard.tsx	Stock table, KPI cards	Stock Brain aur Home ke liye base

HATAO / chhupao (PS se relevant nahi)

File	Kya karna hai
api/delivery.py, api/customers.py, pages/Customers.tsx	Nav se hatao, demo me mat dikhao
agents/order_agent.py, tools/order_tools.py, api/agent.py	Order agent demo me nahi. Code rakhna ho to "future: order-taking" bolo
pages/Orders.tsx	Isko "Sales log" bana do (ya hata do)
pages/Activity.tsx	Repurpose: "Ye recommendation kyu?" (explainability panel)

NAYA BANAO (ye event ka asli kaam hai, isi par judging hogi)

Naya hissa	Kya	Kahan se shuru
Brain engine	forecast, reorder, dead stock, margin leak, expense anomaly, health score, backtest	**Dukaan Dimaag backend ka engine.py** (ready); KiranaFlow tables se data load karne wala adapter likho
Expenses module	Model + API + CSV/quick entry	Dukaan Dimaag db/quick_entry reference
Recommendations API	/api/recommendations, /overview, /finance, /backtest	Dukaan Dimaag main.py reference
Screens	Home, Stock Brain, Money, Ask Brain, Add Data	Mockup PNGs reference
Daily summary / Ask Brain	Hinglish summary + chat	Dukaan Dimaag chat.py reference

4. Engine ko KiranaFlow se jodna (data mapping)

Engine ko chahiye	KiranaFlow me kahan se aayega
products: name, cp, sp, stock, category, unit	Product table (CP/SP/stock pehle se hain). Kuch column na ho to add karo
sales: date, product_id, qty	Order items (date order se, qty item se). Seed me 60 din ke orders generate karo

Engine ko chahiye	KiranaFlow me kahan se aayega
expenses: date, category, amount	**Nayi table** (rent, salary, electricity, transport, wastage, misc)

Dukaan Dimaag ka engine pandas par hai aur apna SQLite use karta hai. KiranaFlow me use ek **chhote adapter** se jodo: **load()** function KiranaFlow ki DB se teen DataFrames (products, sales, expenses) banaye. Baaki saara engine waisa hi chalega. Isse integration ~1-2 ghante ka kaam hai.

> **Dhyan:** engine ke formulas aur recommendations event me likhe gaye hain. Ye teammates ko **samajh aane chahiye** (Q&A; me poochhe jaayenge). Isliye adapter likhte waqt engine.py ek baar line-by-line padh lo.

5. Timeline (is path ke liye)

Kab	Kaam
Abhi (Day 1)	Coordinators se disclosure ki permission. Naya repo + baseline commit. Plan B ka backup zip alag rakho
Day 1 · MVP Dev slots	Expenses model + engine adapter + /recommendations, /overview. Seed data me stories add (stockout, dead stock, margin leak, wastage spike)
Day 1 raat (agar allowed)	Frontend: nav badlo, Home + Stock Brain screens API se jodo
Day 2 · 9-11	Money, Ask Brain, Add Data screens; Customers/Delivery nav hatao
Day 2 · 11-12	Deploy (Render + Vercel), 3 baar poora flow test, backup video
Day 2 · 12:15-12:45	Revenue model slide final
Day 2 · 1:30-2:00	Submit (1:35 tak): deck + MVP link + GitHub repo. Repo me baseline + event commits saaf dikhen

6. README / pitch me disclosure (copy-paste)

README me:
"**Base:** Is repo ka starting point KiranaFlow hai (MIT License, (c) Priyanshu Jaiswal), jo event se pehle bana tha (commit: Baseline). **Event me naya banaya gaya:** Brain analytics engine (forecast, reorder, dead stock, margin leak, expense anomaly, health score), expenses module, recommendations API, 5 mobile-first screens, Ask Brain, quick entry, CSV upload."

Pitch me ek line: "Humne ek existing order-taking base par event me poori decision layer banayi; wahi is PS ka core hai."

7. Q&A;: "Kya ye pre-built hai?" ka jawab

Sach bolo: "Base KiranaFlow tha, jo hum README me disclose kar chuke hain, aur coordinators ko pehle bataya tha. Event me naya: engine, expenses, recommendations, aur saare 5 screens. Commit history me baseline aur event commits alag hain." Ye jawab tabhi kaam karega jab ye sach ho aur permission li gayi ho.

8. Risks

Risk	Bachav
Judges ne pre-built maan kar disqualify/penalize kiya	Disclosure + coordinator permission + event me naya core. Jawab likhit rakho
Coordinators mana kar dein	Plan B: naya repo (backend zip aur mockups ready). Subah hi decide karo
Integration me time kharab	Engine ko adapter se jodo, andar ka logic mat chhedo. 2 ghante me na ho to Plan B
Purani code me bugs/unknown behaviour	Sirf wahi hissa rakho jo demo me chahiye; baaki nav se hata do
Q&A; me engine na samjha pao	Teammates engine.py padhein; formulas PDF (Blueprint section 7) yaad rakhein

9. Antigravity ke liye prompt (is path ke liye)

> "Is repo (KiranaFlow base) ko Small Business Brain me badlo. Blueprint PDF aur mockup images follow karo.
> 1) Naya backend module app/brain/ banao: engine, expenses model, /api/overview, /recommendations, /inventory, /finance, /expenses, /forecast/backtest, /chat, /quick-entry. Engine ka reference code dukaan-dimaag/backend/app/engine.py me hai.
> 2) Frontend: navigation ko 5 screens me badlo (Home, Stock Brain, Money, Ask Brain, Add Data); Customers/Delivery/Orders nav se hatao.
> 3) Seed data me 60 din ki sales + expenses aur 4 stories daalo.
> 4) Purani files ko delete mat karo; sirf nav se hatao. LICENSE aur existing commits mat chhedo. Chhote commits karo."
